Digital Interfaces

Reflecting on the process

Digital interfaces, a course that I had tried to take up to understand the working of beautiful digital layout. As a designer I find myself not equipped to design a visual interface without having the required knowledge of its function. Till now the course has dwelled into coding languages such as css, html and javascript. The understanding of the same gives me a more logical understanding of certain decisions taken while digitally designing a webpage. The process of learning a language of this kind has given me a sense of control over my practice as a designer, earlier I felt that it would all be beyond my understanding. But the duration of this class has made the languages very informal and less complex. The whole process of writing codes and then seeing the output is really fascinating. Realising how a perfected string of commands can generate something very complex and all of this happening in a highly ordered and organised ways is a very captivating experience. I had tried to understand C++ coding language couple of years back but could never relate or get a hold of the same. Through this class and the approach in this class I have overcome my fear for codes.
